

# Docker II - Judgement Day

docker

PUG Challenge Americas  
2016

Thomas Hansen  
whoGloo, Inc.

# Introduction

---

Thomas Hansen  
CEO & Co-Founder of whoGloo, Inc.

Working with OpenEdge since 1995

Working with Docker since 2014 :-)

- Core part of the nodeSpeed development platform and application runtime environments
- Used for internal OpenEdge projects

# What is Docker?

## DOCKER PROJECTS

Specialized tools to help developers build modern, distributed applications.

### DOCKER ENGINE

Create and runs Docker Containers

[Learn More](#)

### DOCKER COMPOSE

Define multi-container applications

[Learn More](#)

### DOCKER REGISTRY

Open source Docker image distribution (not included)

[Learn More](#)

### DOCKER MACHINE

Automated Docker Provisioning

[Learn More](#)

### DOCKER SWARM

Host clustering and container scheduling

[Learn More](#)

### KITEMATIC

Desktop User Interface for Docker

[Learn More](#)

# Containers vs. VMs

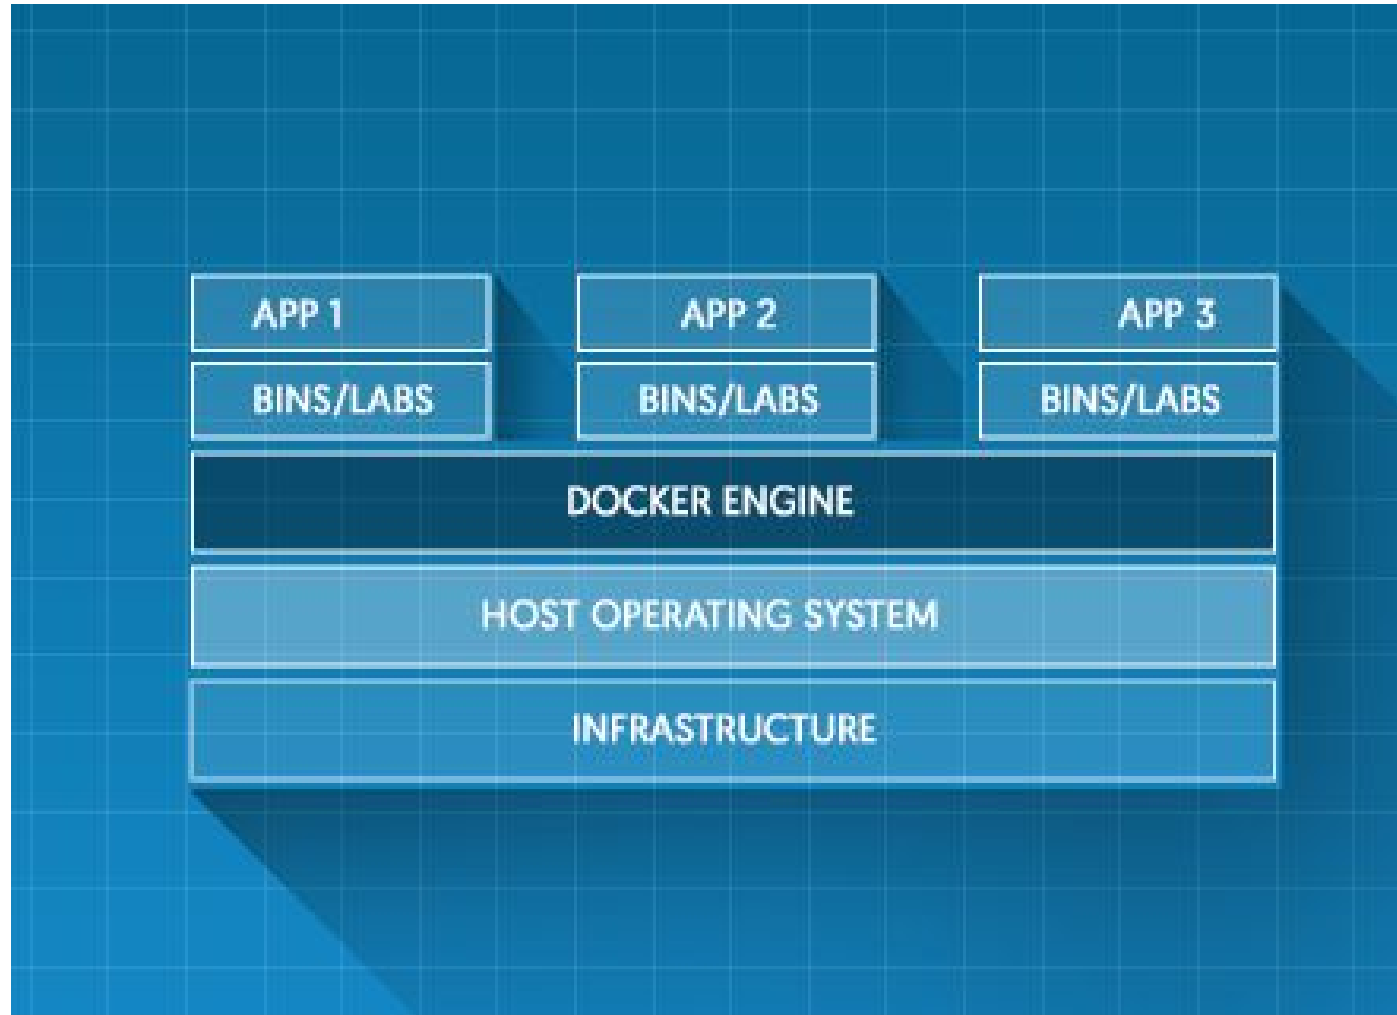

Containers are isolated, but share OS and, where appropriate, bins/libraries

...result is significantly faster deployment, much less overhead, easier migration, faster restart

# Docker Engine

DOCKER ENGINE

Create and runs Docker Containers

# Docker Engine

---

DOCKER ENGINE

Create and runs Docker Containers

**docker create:** create new container from image

**docker run:** run container

**docker exec:** execute a program inside a running container

**docker stop / start / restart**

**docker inspect:** inspect the structure of a container

**docker cp:** copy data between host and containers

**docker rm:** remove docker container

**docker rmi:** remove docker image

# Docker Compose

DOCKER COMPOSE

Define multi-container applications

GET STARTED IN 3 STEPS:

1

WRITE YOUR DOCKERFILE

```
WORKDIR /code
ADD requirements.txt /code/
RUN pip install -r
requirements.txt
ADD . /code
CMD python app.py
```

2

WRITE YOUR COMPOSE.YML FILE

```
web:
  build: .
  links:
    - db
  ports:
    - "8000:8000"
db:
  image: postgres
```

3

RUN YOUR APP

```
$ docker-compose up
```

# Docker Compose

---

“Recipes” for projects with multiple containers

DOCKER COMPOSE

Define multi-container applications

```
openedge:  
  image: whogloo/openedge116  
  volumes_from:  
    - openedge_dev_data  
  ports:  
    - 9090:9090  
openedge_dev_data:  
  image: busybox  
  volumes:  
    - /data
```

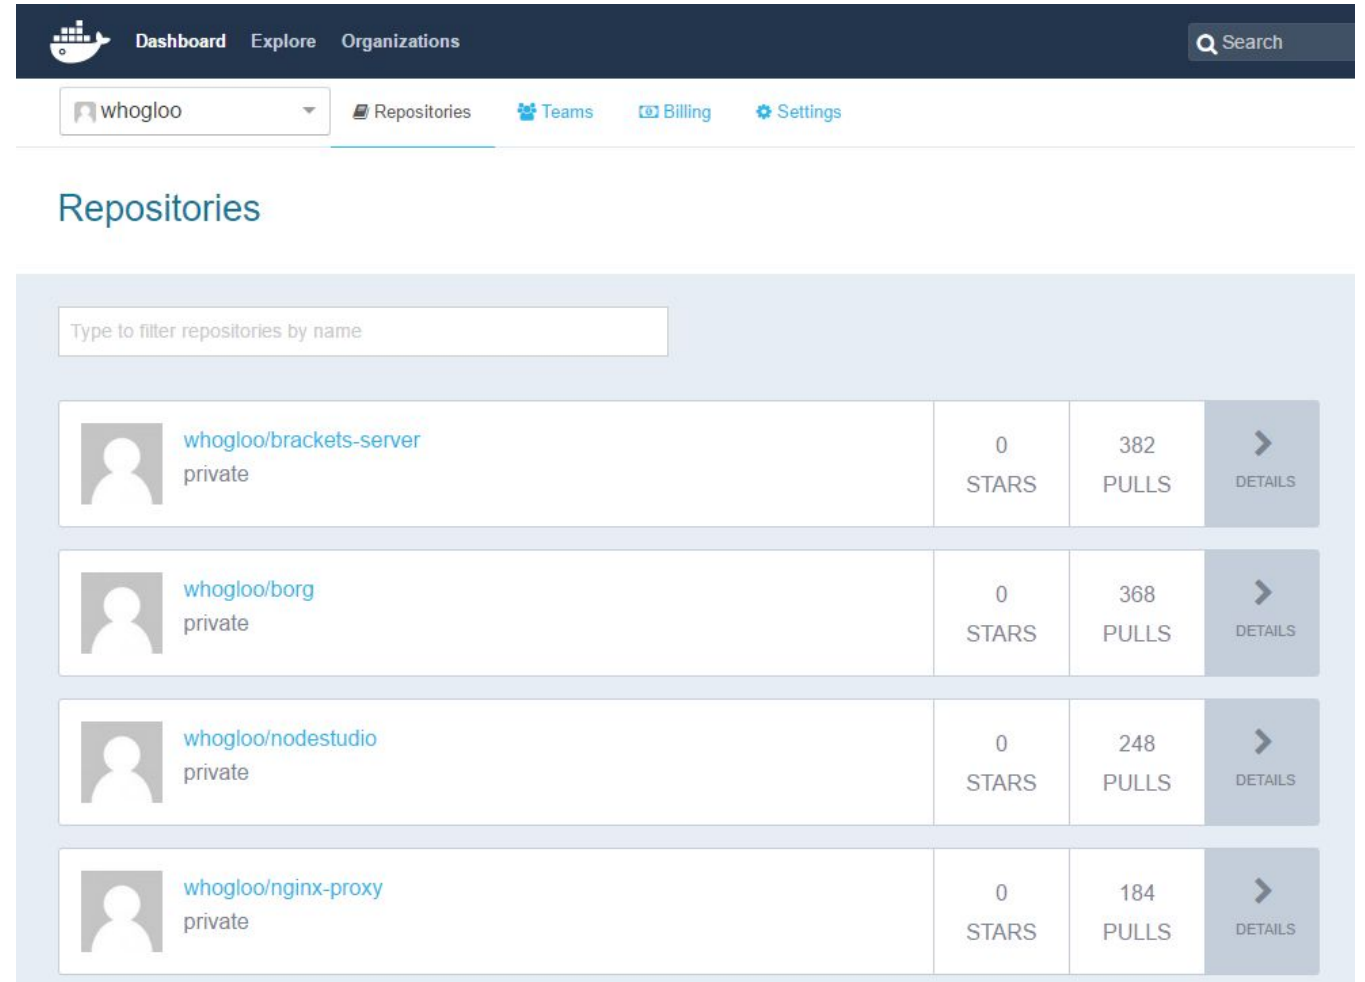

# Docker Hub

Cloud service (registry)

Share Applications

Automate workflows

Assemble apps from components

The screenshot displays the Docker Hub interface for the user 'whogloo'. The top navigation bar includes 'Dashboard', 'Explore', and 'Organizations'. Below this, the user's profile 'whogloo' is shown with links to 'Repositories', 'Teams', 'Billing', and 'Settings'. The main content area is titled 'Repositories' and features a search input field labeled 'Type to filter repositories by name'. A table lists four private repositories:

Repository Name	Stars	Pulls	Action
whogloo/brackets-server private	0	382	DETAILS
whogloo/borg private	0	368	DETAILS
whogloo/nodestudio private	0	248	DETAILS
whogloo/nginx-proxy private	0	184	DETAILS

# Docker Registry

---

“The Registry is a stateless, highly scalable server side application that stores and lets you distribute Docker images.”

You should use the Registry if you want to:

- Tightly control where your images are being stored
- Fully own your images distribution pipeline
- Integrate image storage and distribution tightly into your in-house development workflow

DOCKER REGISTRY

Open source Docker image distribution [not included]

# Docker Machine

Automates all the provisioning and installation tasks for a single Docker host

```
$ docker-machine create -d virtualbox dev
```

```
$ docker-machine create --driver amazec2 aws-sandbox
```

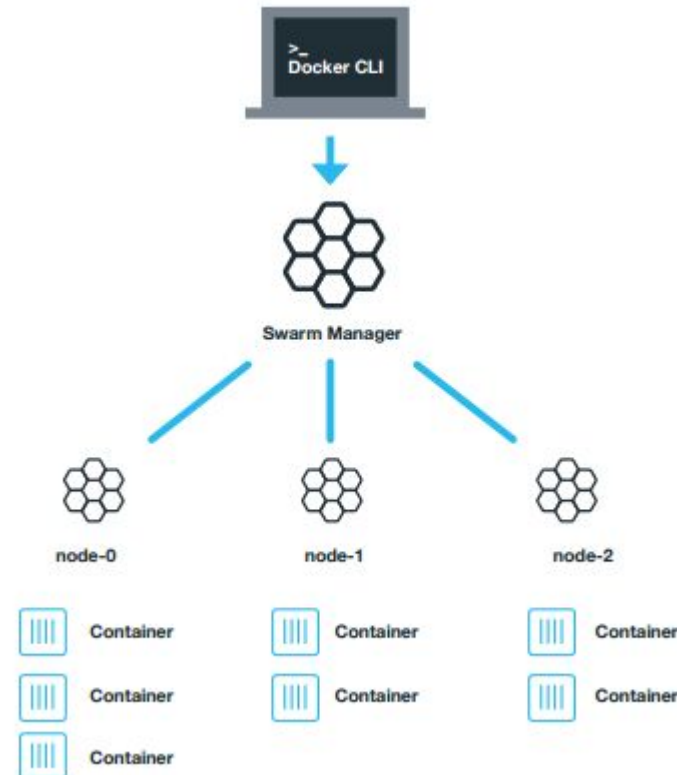

# Docker Swarm

DOCKER SWARM

Host clustering and container scheduling

# Docker Swarm

## Create a swarm

```
docker-machine create -d virtualbox \  
  --swarm --swarm-master \  
  --swarm-discovery token:// swarm-master
```

DOCKER SWARM

Host clustering and container scheduling

## Create more docker hosts for swarm

```
docker-machine create -d virtualbox \  
  --swarm --swarm-discovery token:// swarm-node-00
```

# Docker Cloud

---

“Docker Cloud is a hosted service that provides a Registry with build and testing facilities for Dockerized application images, tools to help you set up and manage your host infrastructure, and deployment features to help you automate deploying your images to your infrastructure.”

# Docker Volumes

---

Volume drivers exist for

- AWS S3
- GlusterFS
- Flocker
- Azure File Storage
- VMWare
- NFS
- .....

# Docker for Windows

---

- Docker for Windows and Kitematic currently in beta
- Download and test today

# Docker Store

---

- “a marketplace for trusted and validated dockerized software – free, open source and commercial”
- Private Beta just launched

# Docker & OpenEdge

---

The following slides contain information of a highly sensitive nature - of which you will have no recollection when you leave...

# Need OpenEdge?

---

Need OpenEdge to run databases, AppServer, WebSpeed?

- Install Docker
- Build images
- Push images
- Pull images to any machine
- Configure containers
- Run

# OpenEdge & Docker

---

Quickly pull and use OpenEdge on any supported platform

**No installation on host required!**

- Run & maintain databases
- Run AppServers
- Run WebSpeed
- Execute ad-hoc OpenEdge jobs

# OpenEdge & Docker

---

- Test applications on multiple OpenEdge versions/platforms - **on one host without installing** - just pull and run

# OpenEdge & Docker

---

- Develop
- Test
- Build
- Deploy
- Install

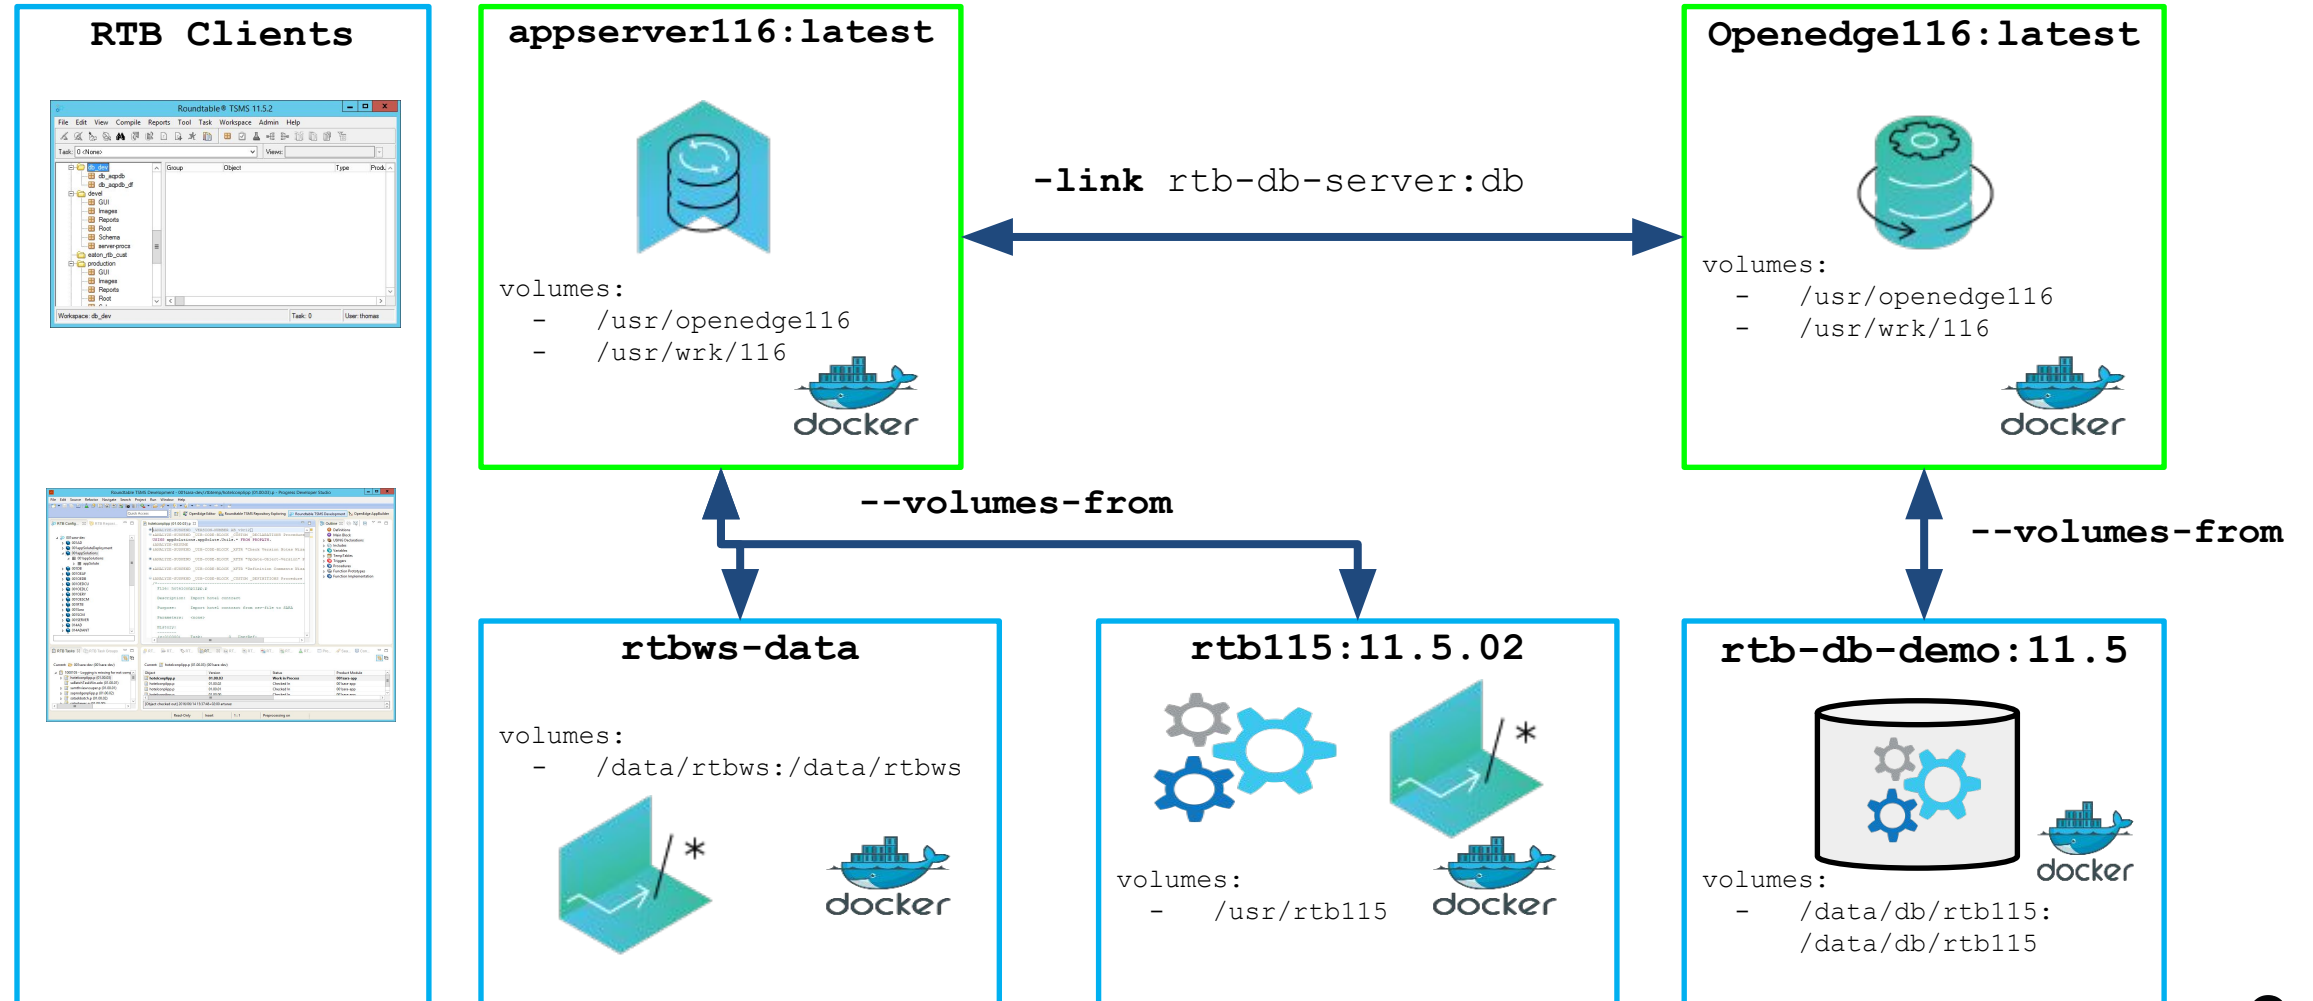

# OpenEdge in Docker examples

---

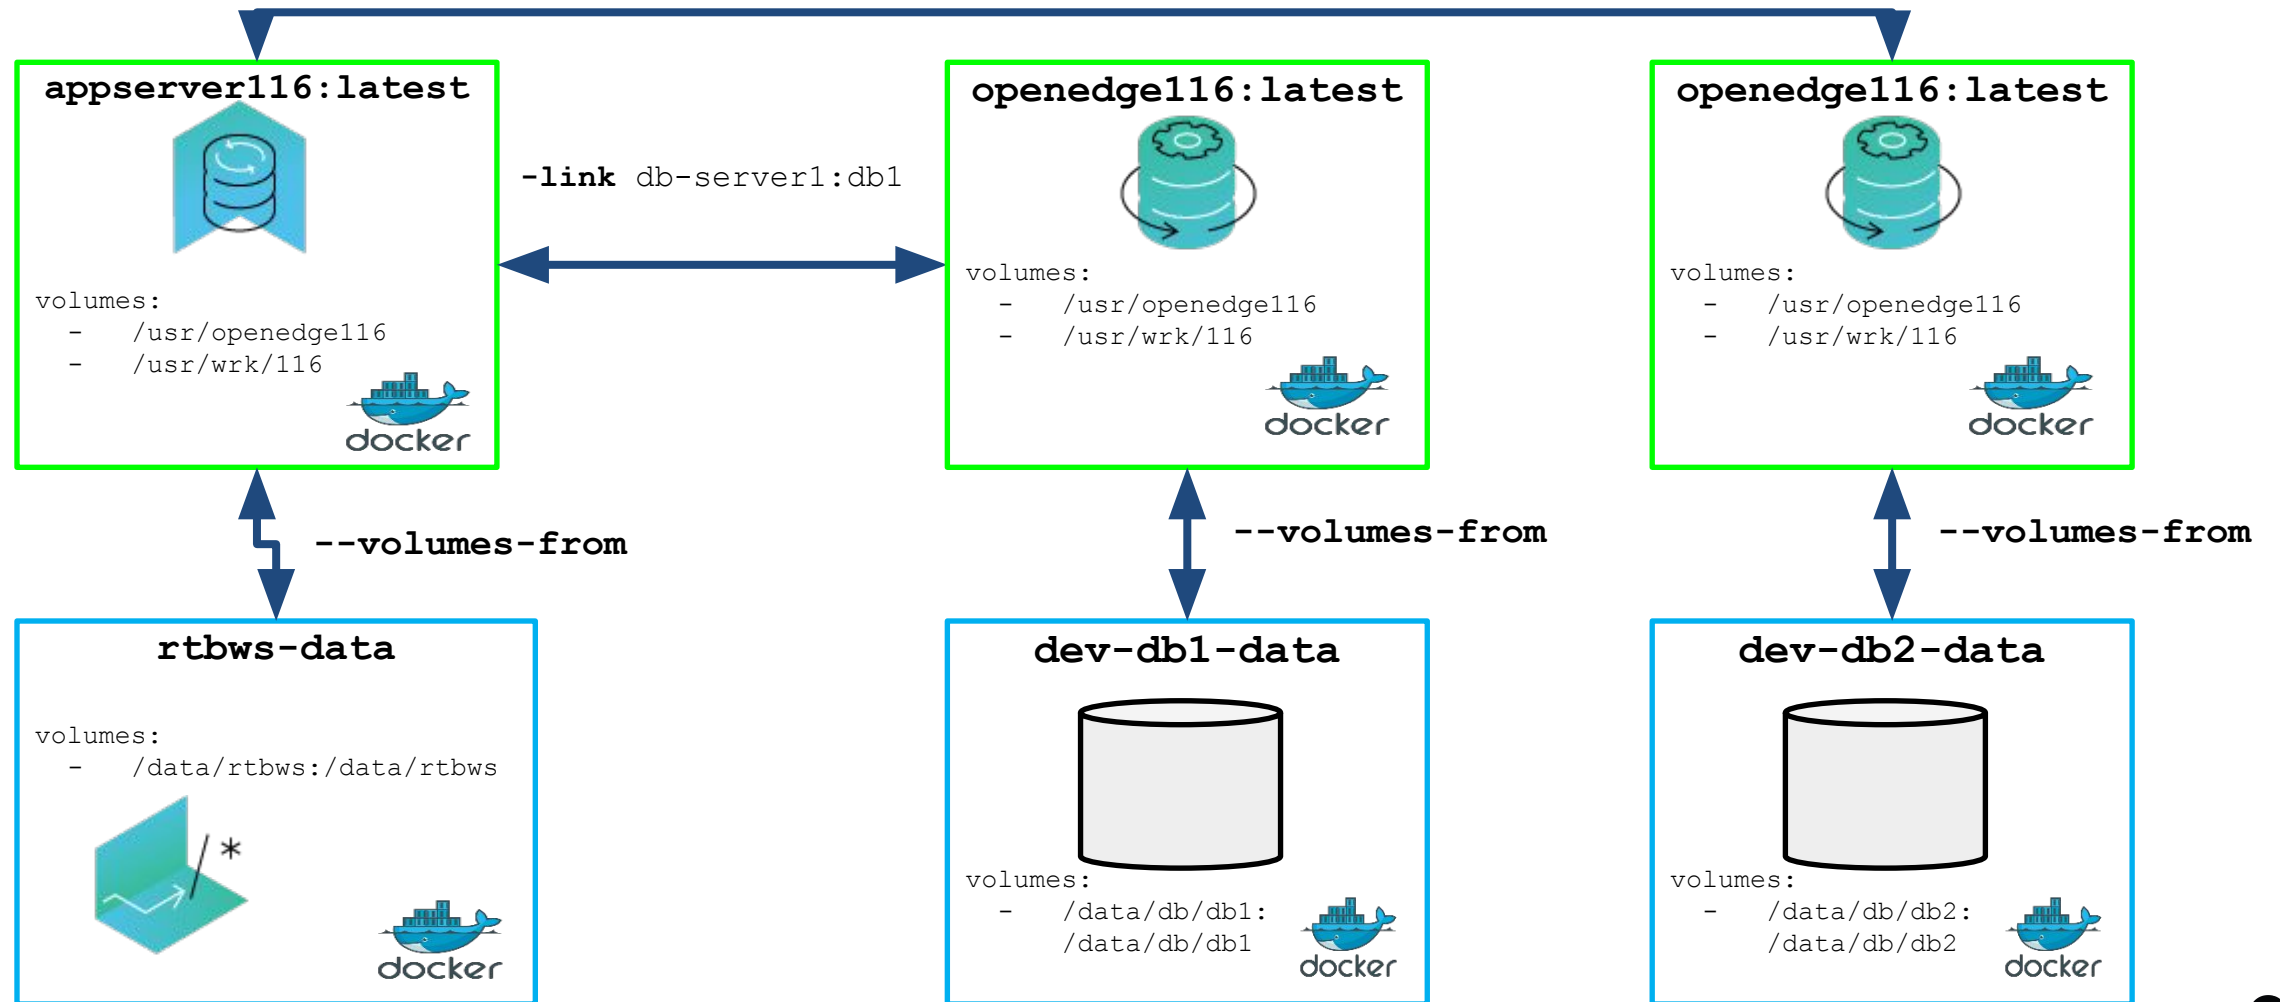

# Roundtable TSMS in Docker

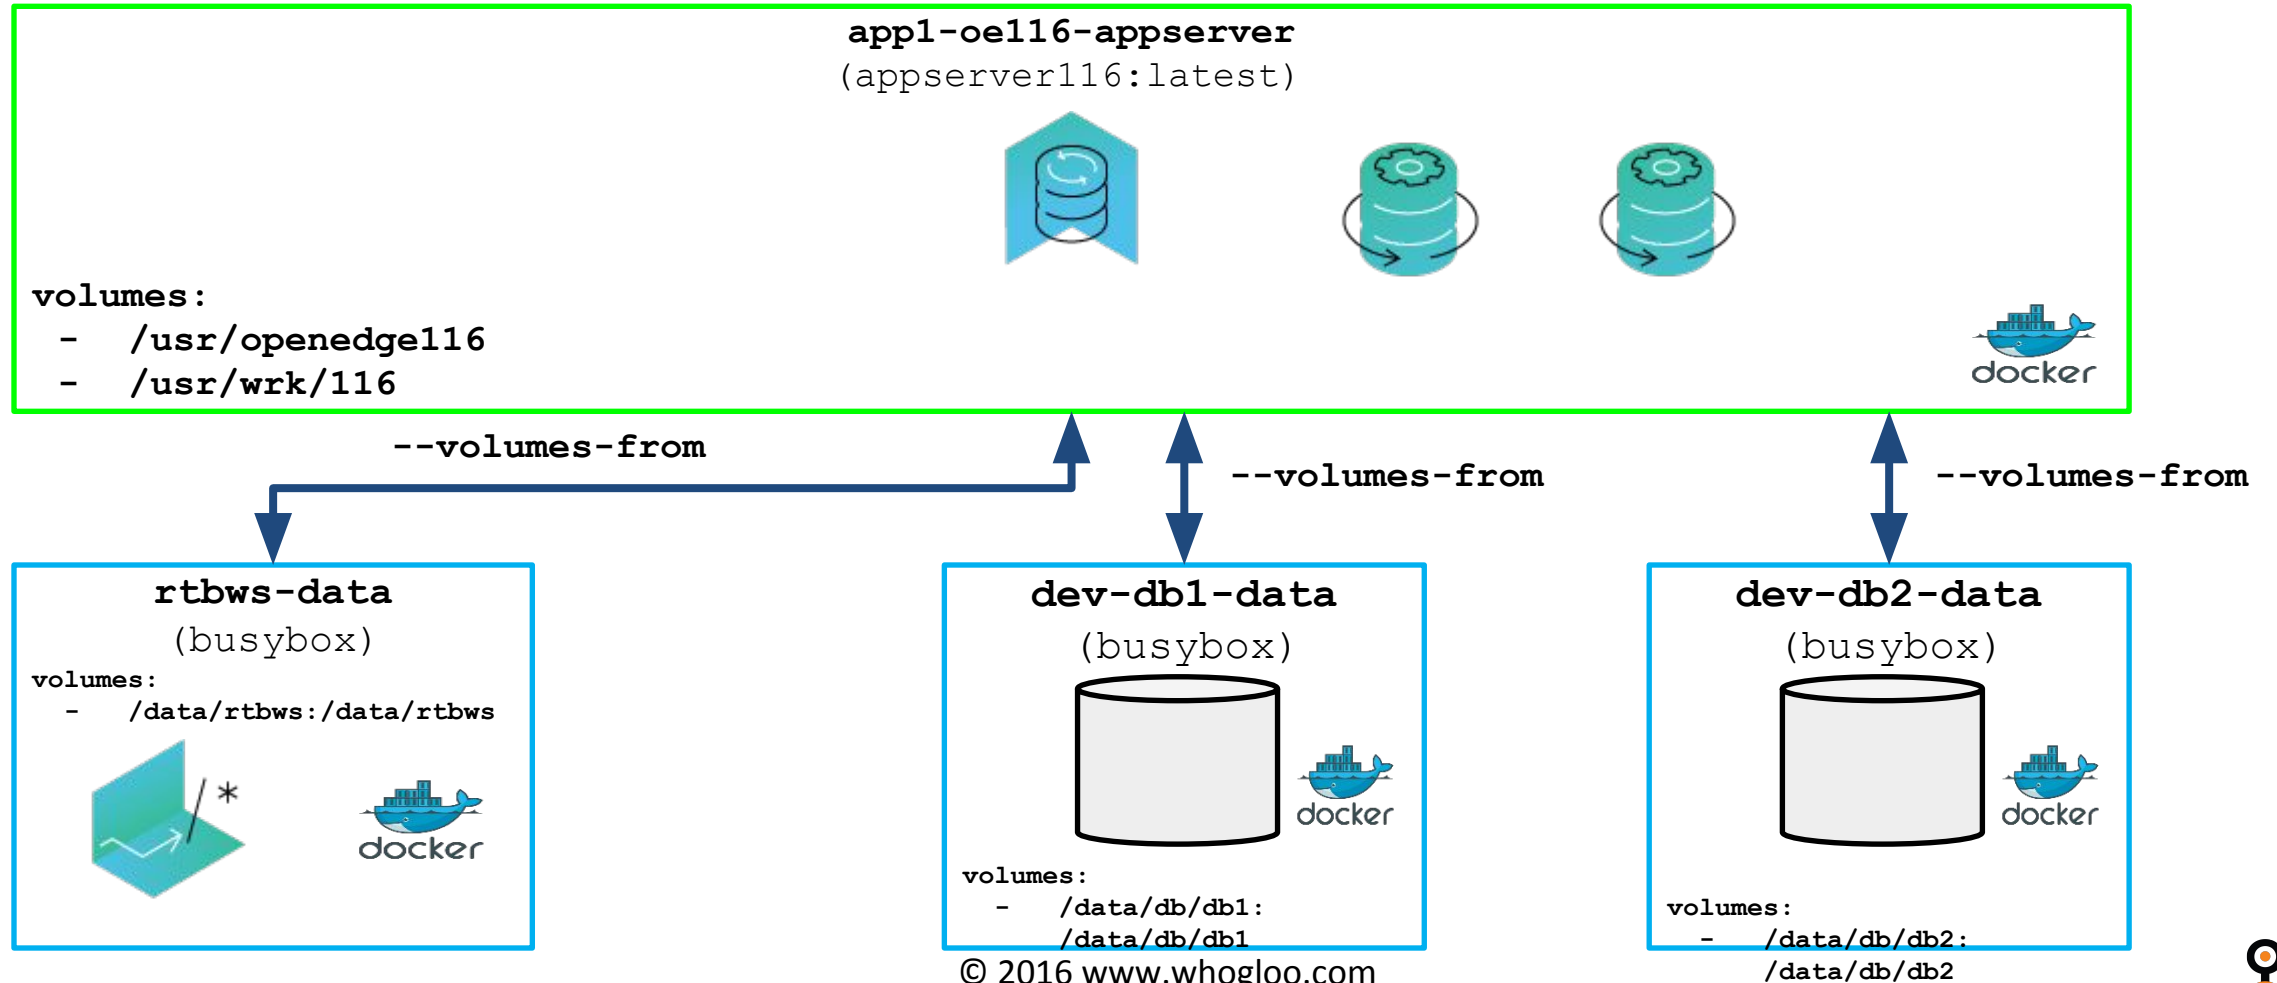

# Development Containers

# Shared memory

# OpenEdge Demo

---

# Docker Build

---

After application deployment and build - put it into a container

```
echo "Deleting existing server dirs..."  
rm -fr server-runtime  
  
echo "Copying new server dirs..."  
cp -R ${buildRootDir}/ server-runtime  
dos2unix server/*.sh  
  
echo "Building docker image..."  
docker build -t ${imageName} .
```

# Docker Build

---

```
# Dockerfile TO CREATE App Runtime container.
```

```
FROM busybox
```

```
COPY ./server-runtime /data/app/runtime
```

```
VOLUME /data/app
```

# Use

---

```
# Pull app runtime images from repo
docker pull whogloo/app:03.00.10

# Create data container from tagged image
docker create \
  --name=cust1-app-runtime-data \
  03.00.10 nodeable/app-server-runtime:

# Start runtime containers using data container
docker run \
  ...
  --volumes-from cust1-app-runtime-data
  ...
  whogloo/appserver116
```

# Docker Pros

---

- Fast, flexible & scalable
- Huge traction – changes and tools coming out all the time
- Abstraction of services into micro services
- Image layers
- Runs on many platforms – even Raspberry Pi!
- Content and hardware agnostic
- Separation of duties

# Docker Cons

---

- Keep an eye on disk space!
- Concepts can be complicated to start with
- ~~Lack of graphical tools – command line~~
- Lack of dynamic port exposure
- Many containers to keep track of
- ~~Not available on Windows - yet~~
- Lack of OpenEdge support
