Agenda

- History Lesson
- Who is SIG?
- Demo
- proALPHA Case Study
- Final Thoughts

Your Code Over Time

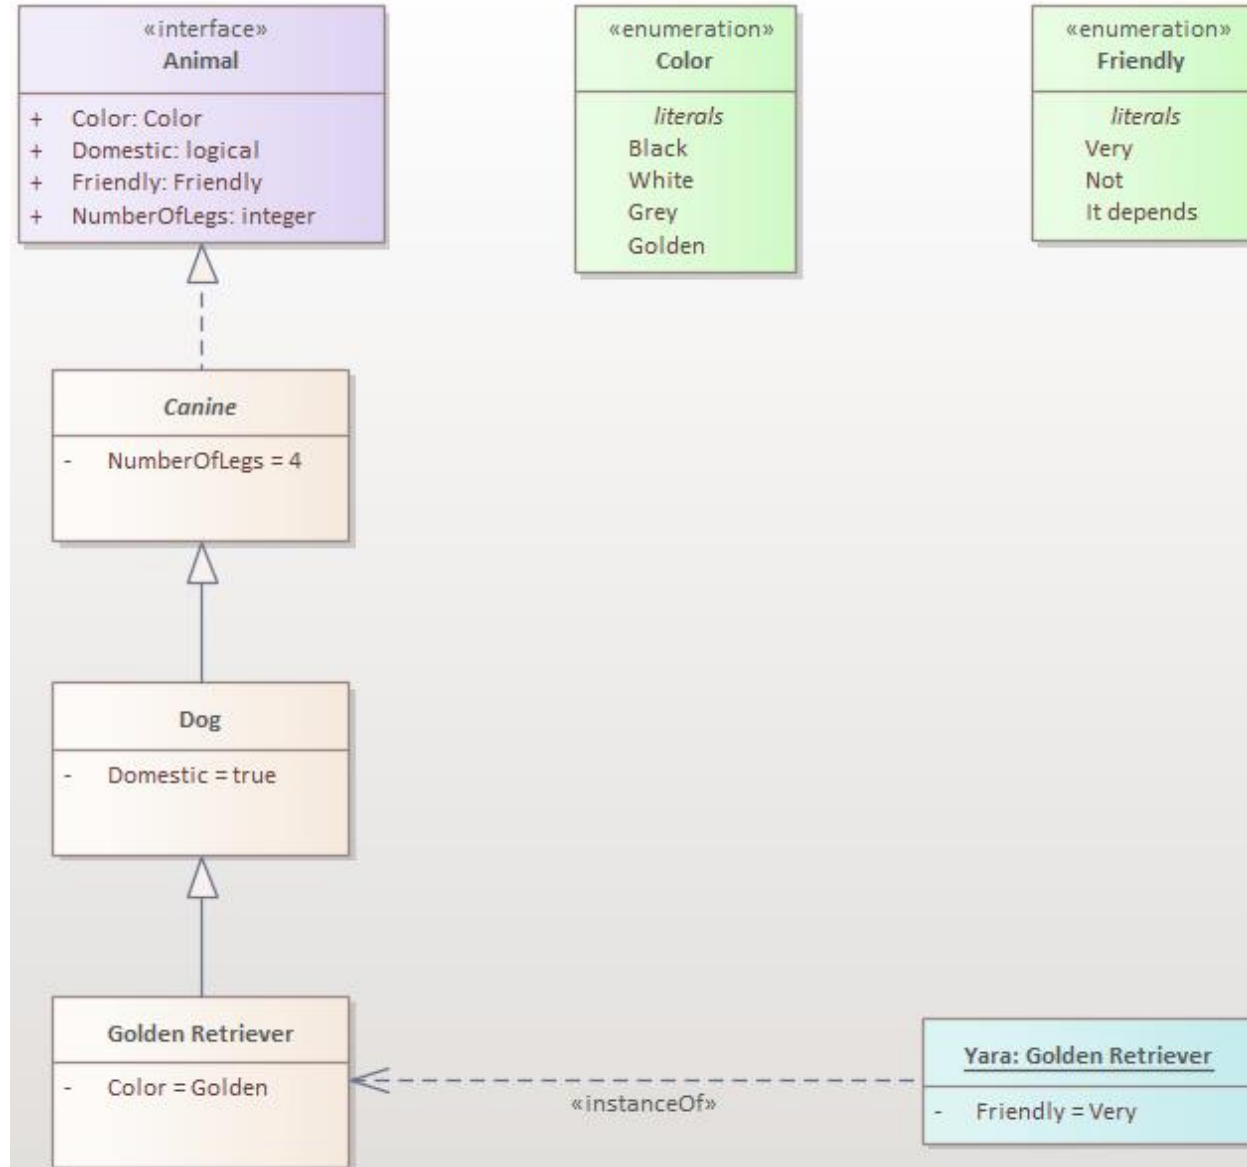

Procedural code

```
DEFINE VARIABLE cColor           AS CHARACTER INITIAL 'Golden' NO-UNDO.  
DEFINE VARIABLE cFriendly        AS CHARACTER INITIAL 'Very'   NO-UNDO.  
DEFINE VARIABLE iNumberOfLegs    AS INTEGER     INITIAL 4      NO-UNDO.  
DEFINE VARIABLE hYara            AS HANDLE      NO-UNDO.  
  
RUN goldenretriever.p(INPUT cColor,  
                      INPUT cFriendly,  
                      INPUT iNumberOfLegs)  
  
PERSISTENT SET hYara.
```

State-of-the-art OO Implementation

VAR Animal Yara =

NEW Golden_Retriever(Friendly:Very).

GETTING SOFTWARE RIGHT FOR A HEALTHIER DIGITAL WORLD

Sigrid

Sigrid® provides (continuous) insight into software build quality, costs, security, and other risks, to support ROI based transformations

Sigrid® | Landscape Scan

Full scan of all software code to provides fact-based, risk identification within 2 weeks for prioritization, budgeting and planning purposes.

Scientific research

The SIG research department develops our measurement models and contributes to advancements in the field of software engineering.

Benchmarking

The SIG software analysis database is the largest in the world, containing more than 85 billion lines of code.

TUViT® Certification

SIG is the first company in the world with a laboratory accredited by TÜV iT to certify software for ISO 25010.

A benchmarked approach to reduce software risks, costs while increasing velocity

QSR: Quality and Security Management

OpenEdge Application Quality and Security Management Service (QSM)

Goals

Set your goals
Security findings
Maintainability
Test code ratio
Architecture quality

Maintainability

Maintainability score
compared to the
industry
Where are the risks
Where to improve

Security

Automated finding of
security threats in your
codebase
Based on industry
standards (OWASP,
ISO 5055, CWE, PCI
DSS)

Architecture

Shows the architecture
as it is implemented
and how it's being
maintained
Helps you to find
opportunities on how it
can be improved

DEMO

Maintainability

Volume

Having an independent system will ease maintenance

Duplication

Write code once

Duplicated code wastes time, as future changes will need to be applied to all copies. This might also introduce bugs if you inadvertently forget to update one of the copies.

Unit size

“The first rule of functions is that they should be small.

The second rule of functions is that they should be smaller than that.”

Recommended practice

Inadvisable practice

Risk categories

Unit complexity

McCabe Cyclomatic Complexity

$$\text{NUMBER_OF_BRANCHES} + 1$$

Recommended practice

Unit

Inadvisable practice

Unit

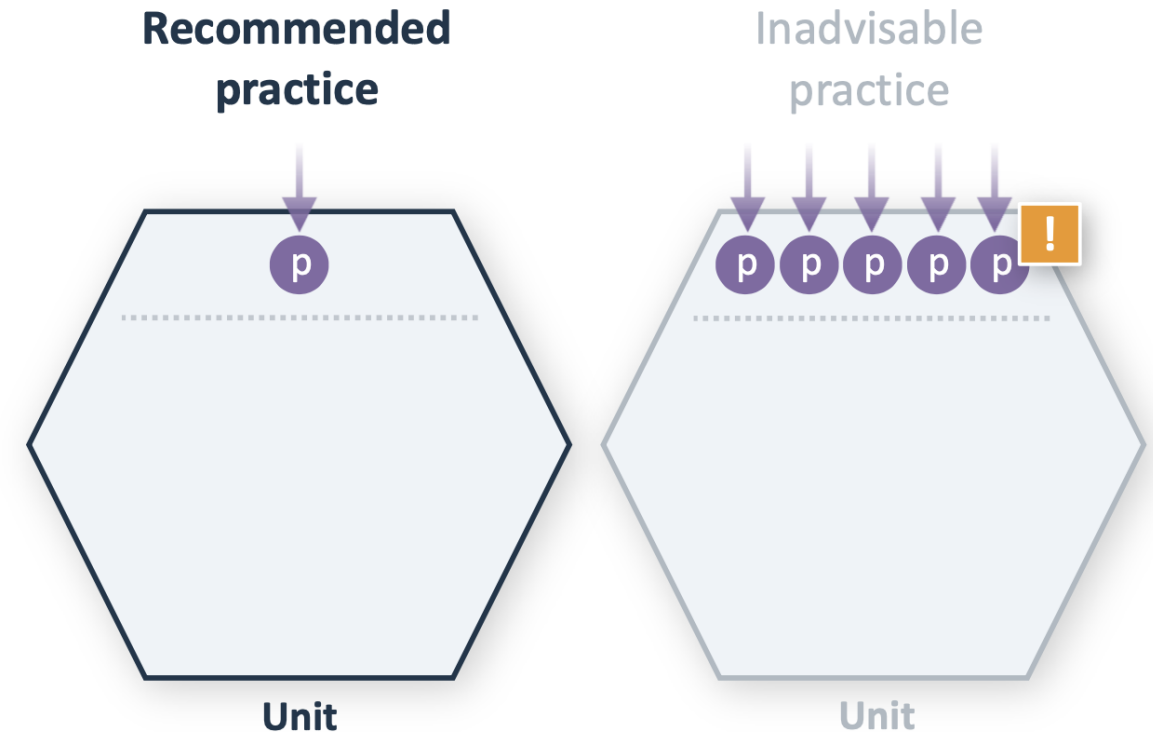

Risk categories

Unit interfacing

Keep unit interfaces small

Avoid creating procedures/methods that take many parameters, as it makes them inconvenient to call or reuse.

Risk categories

Module coupling

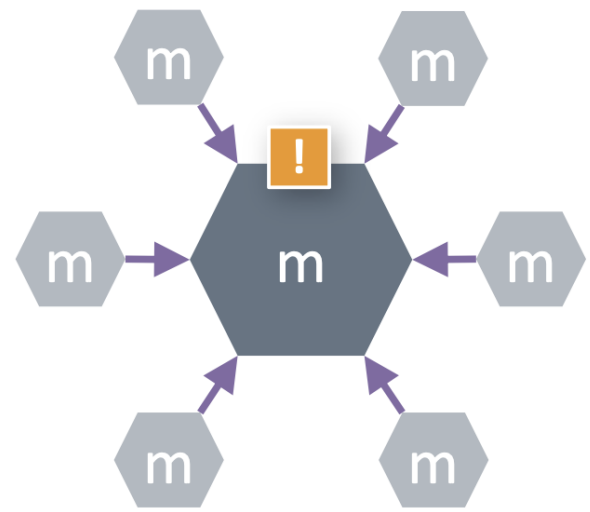

Separate concerns in modules

Separation of concerns leads to smaller and more loosely coupled modules (i.e. files).

Recommended practice

Inadvisable practice

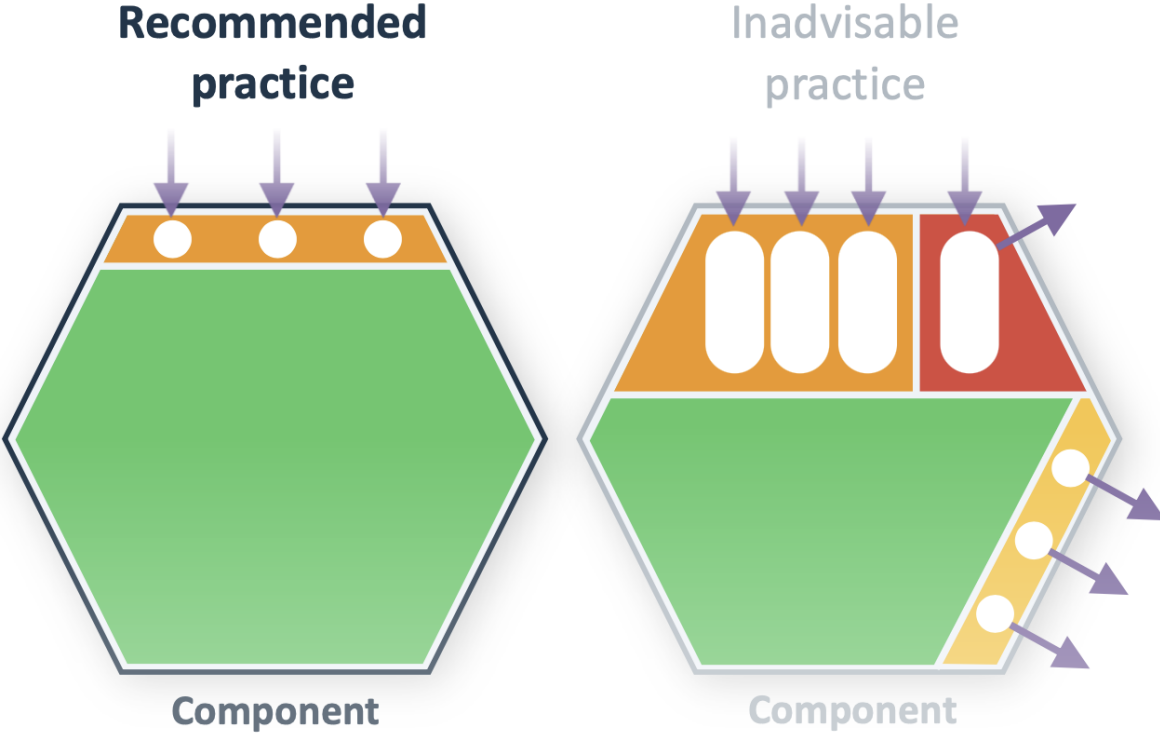

Risk categories

Component independence

Couple architecture components loosely

Separate components into an interface, that receives incoming communication from other components, and an internal part.

Component entanglement

High entanglement indicates flaws in your functional decomposition

Example

Recommended practice

Inadvisable practice

Architecture

Code breakdown

Components should be equally divided

This will spread the need for modifications, make it easier to have several teams work on the same application and spread the knowledge.

All changes in a single large component

Most changes in a single large component

Many changes scattered across multiple components

Changes isolated to one or two components of limited scope

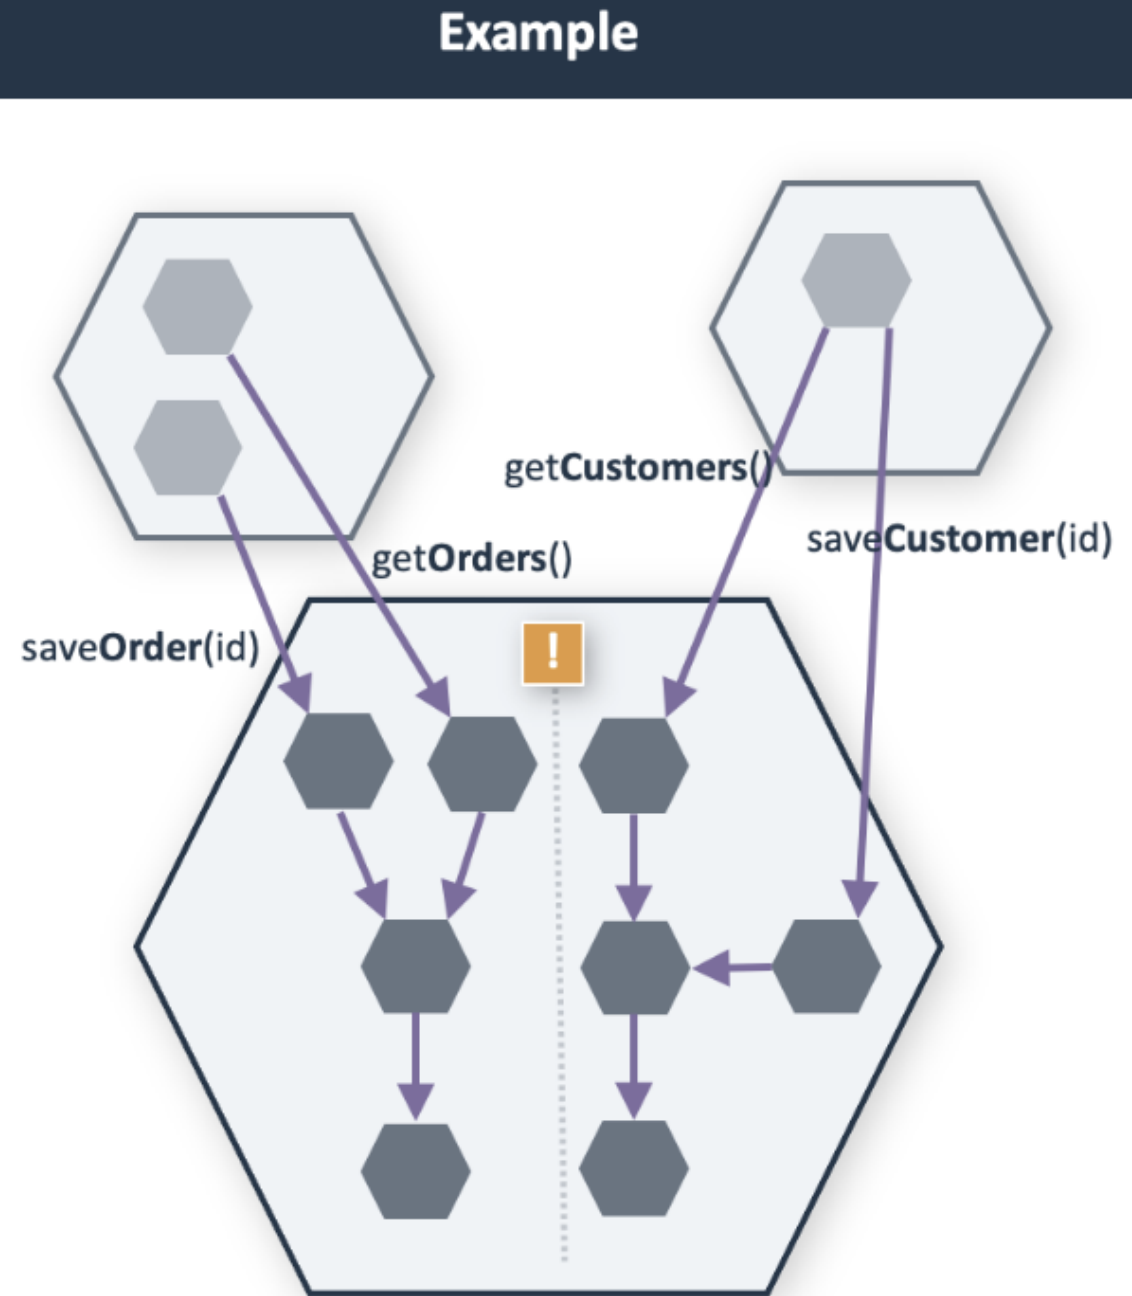

Component coupling

Sum of incoming and outgoing dependencies between components

Component cohesion

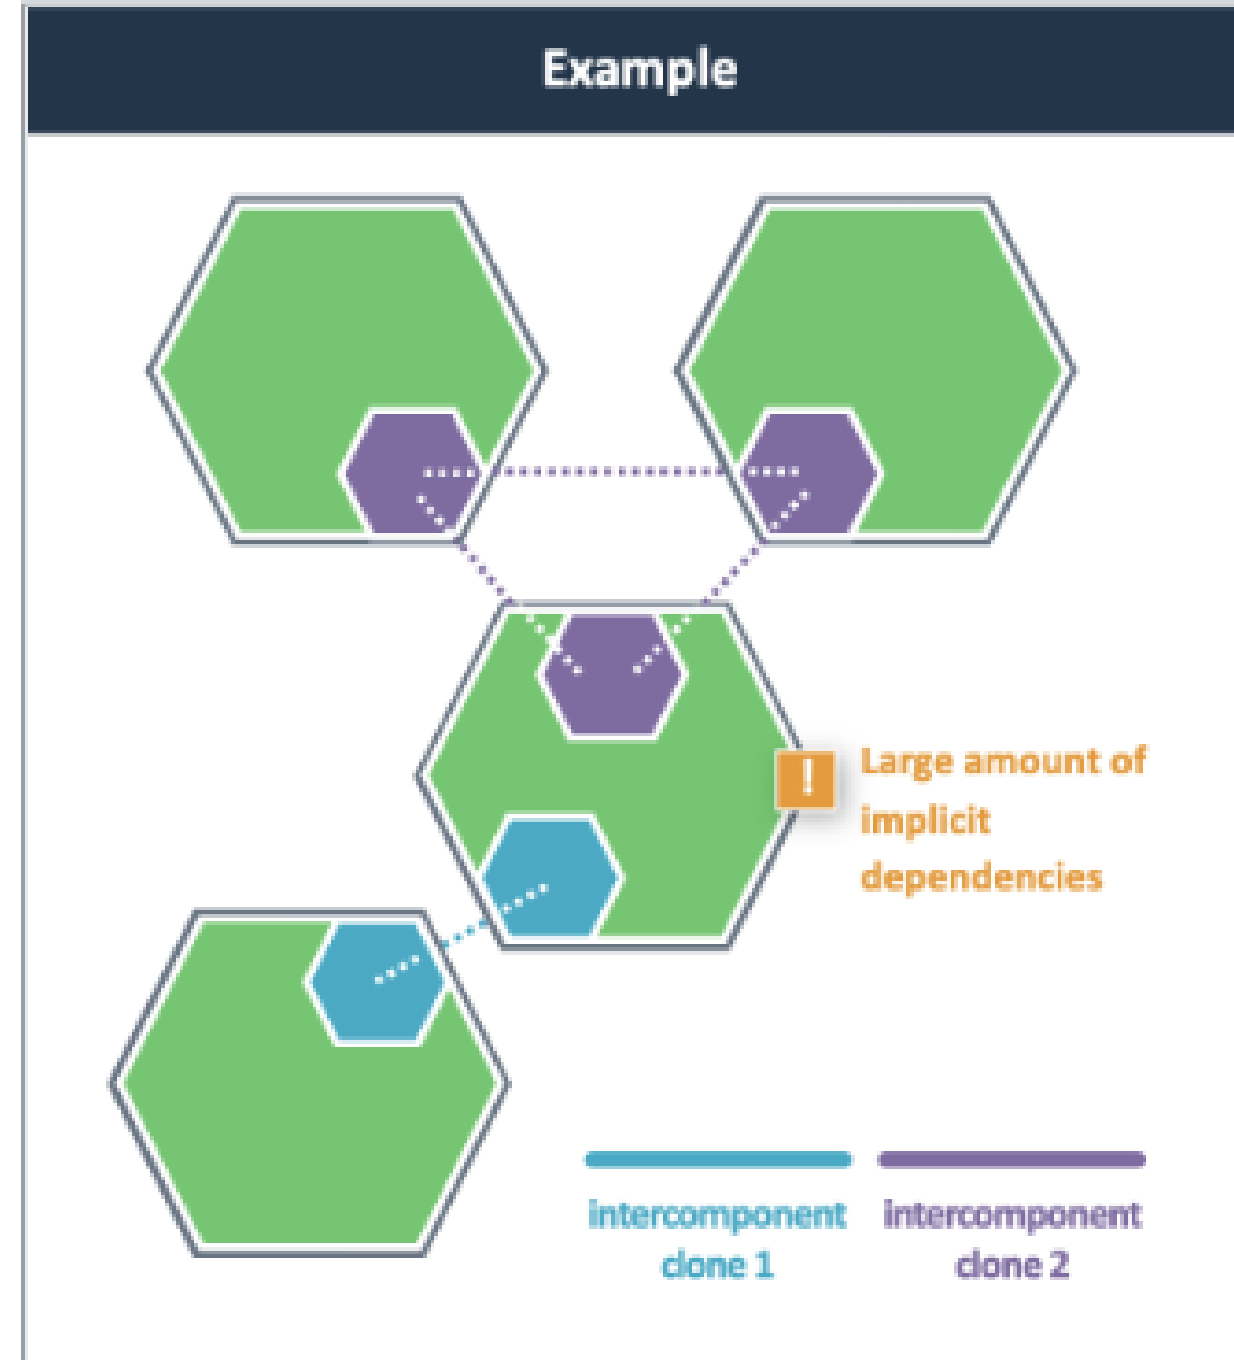

Ratio between the component's internal and external dependencies. Higher is better.

Code reuse

Shows duplication within and between components.

Adds up the number of lines that are duplicate in total.

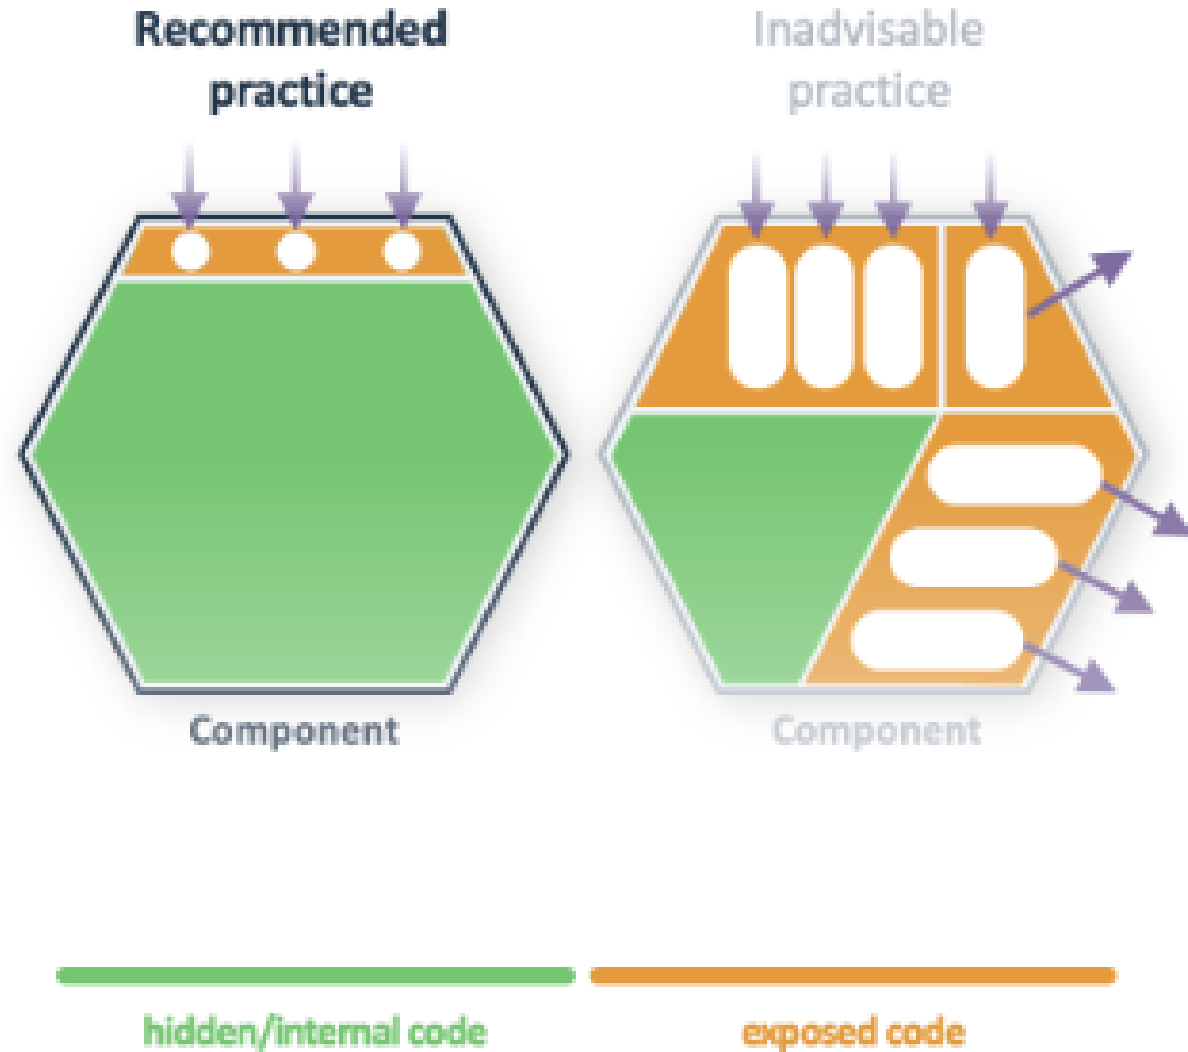

Communication centralization

Percentage of code NOT involved in direct communication with other components.

Higher is better.

Example

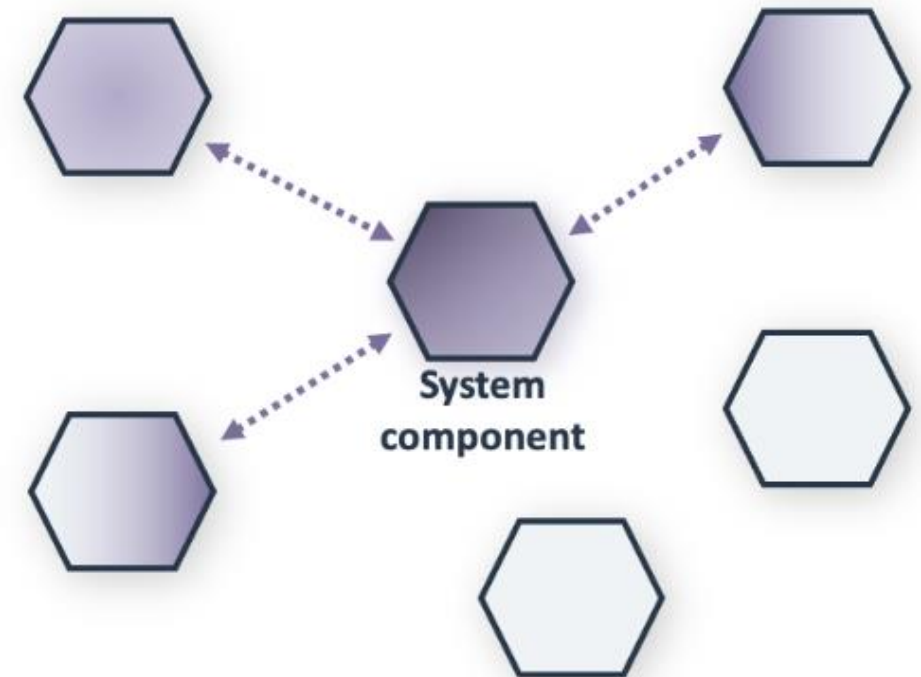

Bounded evolution

Measures the degree of co-evolution of components within a system based on the frequency of coupled code modifications over time.

Example

Change introduced to one component can have an effect on other components

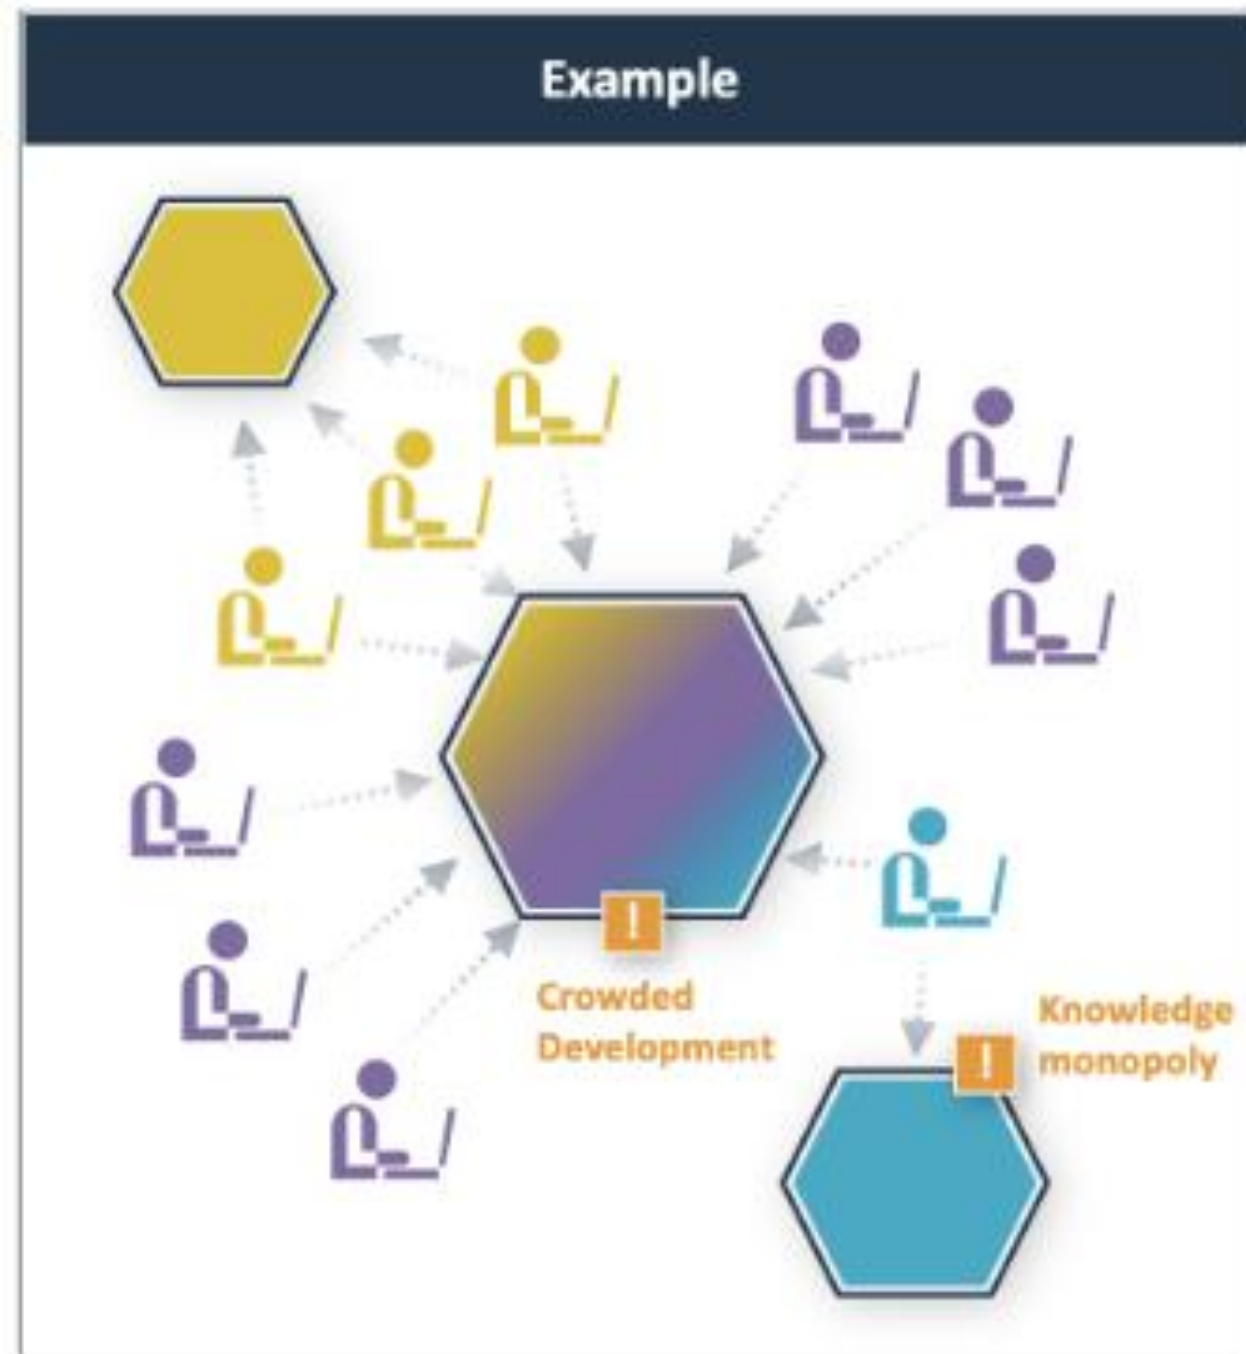

Code Churn Percentage

Knowledge distribution

Measures the degree to which development can grow and retain knowledge over a given system.

Component freshness

Measures the degree to which components are actively being kept up to date and maintained.

Example

Distributed Churn

Inadvisable practice

Code Churn Percentage

| <input type="checkbox"/> Type | Location | CVSS severity |
|--|-------------------|---------------|
| <input type="checkbox"/> Variables should be initialized with the NO-UNDO flag Weakness: Improper Resource Shutdown or Release Origin: SIG SAT Violations | .../Array.cls:212 | 0.0 |

```
79 for each Tenant share-lock by Tenant.Name:  
80  
81 if not can-find(first ApplicationUser where  
82     ApplicationUser.TenantId eq Tenant.TenantId and  
83     ApplicationUser.EmployeeId ne '') then  
84     next.  
85
```

A SHARE-LOCK is used instead of an EXCLUSIVE-LOCK

Done

Problem Description

In concurrent programming, managing access to shared resources is critical to prevent race conditions and ensure data integrity. A SHARE-LOCK allows multiple threads or processes to read a shared resource but prevents them from writing to it simultaneously. However, if a situation requires exclusive access to a resource for updates or critical operations, an EXCLUSIVE-LOCK should be used instead. Using a SHARE-LOCK when an EXCLUSIVE-LOCK is needed can lead to deadlocks, where two or more operations are waiting indefinitely for each other to release locks.

Problem Example

```
1 FIND FIRST Customer SHARE-LOCK NO-ERROR.  
2 IF AVAILABLE Customer THEN DO:  
3     Customer.Balance = Customer.Balance + Invoice.Total.  
4     UPDATE Customer.Balance.  
5 END.
```

The background is a deep blue gradient with a complex, abstract pattern of glowing white and light blue lines. These lines form a central, star-like or cross-like shape that radiates outwards. The lines are composed of many small, bright points connected by thin, curved segments, giving the impression of a digital network or data flow. In the background, there are faint, repeating patterns of binary code (0s and 1s) in a lighter blue color, which are slightly out of focus, adding to the digital aesthetic.

proALPHA Codebase

- Code is well organized with a very strict folder and naming scheme
- First two letters are always module / submodule
- Third letter is type of program such as
 - b for browser
 - v for viewer
 - r for super procedure
 - and many more ...
- Very strict formatting rules, checked automatically with static code checks ...
- Our code base looks the same for all the 9 million lines of code

proALPHA Codebase

- With this measures (and some more) we have very good control of our code base and can work on it with 200+ developers
- Nevertheless – we do have a noticeable increase of maintenance effort over the last couple of years
- We were looking for ways to lower this maintenance effort again

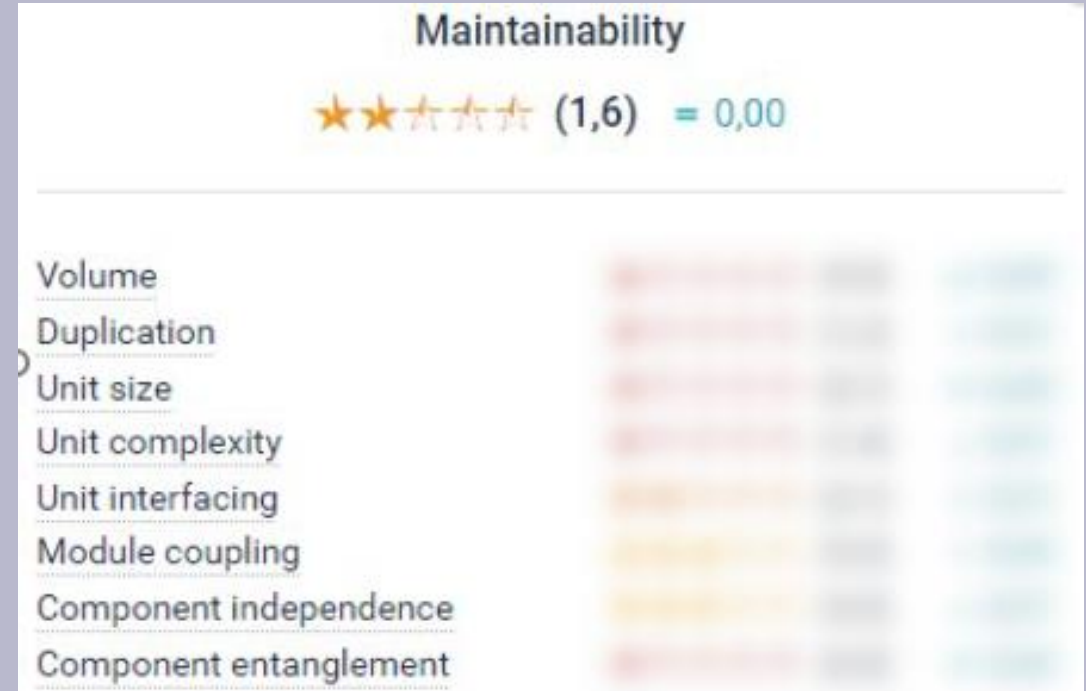

SIG comes into the picture!

proALPHA and SIG

- Progress asked us if we want to do a POC with SIG in December 2022
- The POC was planned for 6 month and ended in July 2023
- After the initial POC we did not immediately sign a contract
- The reason was SIG's handling of dependencies (details to follow)
- SIG corrected all our complaints, so we use SIG since April 2024

SIG Rating of our Codebase

- On a first glance this looks very bad
- Maintainability is NOT Quality!!
- Our strict code organisation is reflected in good numbers for Module Coupling and Component independence
- Duplication, Unit Size and Unit Complexity reflects more Progress „Specialities“ than absolute quality
- Does not change that improving this numbers should lower maintenance efforts!!

Evaluation of the key figures in context of OE / pA

- Volume
- our strict naming conventions are an adequate replacement for smaller repositories
- In the foreseeable future, we will not split the proALPHA code base into smaller repositories, so this number will not improve

Evaluation of the KPIs in context of OE / pA

- Duplications
- there is a lot of generated code, especially for the UI (Appbuilder) by using XFTRs
- This KPI does not show the correct value for the self-written business code

Evaluation of the KPIs in context of OE / pA

- Duplications
- there is a lot of generated code, especially for the UI (Appbuilder)
- This KPI does not show the correct value for the self-written business code
- You need to exclude these hits manually
- If any of the files are changed, the hit will reappear
- We are negotiating with SIG to change this

The screenshot displays a software interface with two main components. On the left, a 'Description' box contains the following text: '34 lines occurring 1.159 times in 1.159 files: eublie01.w, ebbdea03.w, fabkpi01.w, d_bglo20.w, bebtxt00.w, sbbcbu12.w, s_bvar00.w, sbbgua01.w, vsbpos02.w, imbsti00.w, bjbstc00.w, s_bgro02.w, mbbakt07.w, drbcls00.w, ivbbra20.w, mlbort03.w, ivbaka02.w, mpbres10.w, fbbsit00.w, ebbqmt01.w, usbprc10.w, s_bbra00.w, s_bart04.w, sbbdup00.w, abbvor00.w, drbare01.w, fobbvb01.w, rbbstd03.w, dbbmen00.w, s_bbnk00.w, rabekb01.w, vsbsoc01.w, vsbcal04.w, vpbpla05.w, vcbkok00.w, vbboap01.w, d_blic00.w, vubrah06.w, bbbcti02.w, s_babii0.w, ebbqmt34.w, s_blie02.w, sbbmet11.w, sbbmet00.w, sbbdutr1.w, bubrec11.w, bobprt10.w, bubben01.w, mbbakt05.w, s_bsna00.w, ivbkz20.w, mmbpac22.w, e_bwe_03.w, bubfkt12.w, jbbpro04.w, vubart01.w, sbbdff30.w, a_bidx00.w, iabspa00.w, e_bbel15.w'. On the right, a menu is open, showing a 'Raw' button with a question mark icon and a three-dot menu icon. Below these are two options: 'Prioritize' with a wrench icon and 'Accept risk' with a checkmark icon.

Evaluation of the KPIs in context of OE / pA

- Code Snippet has 32 lines
- Only this isolated snippet is already high risk
- What do you really do with something like that?

Risk categories

```

Dependency Specialties

- SIG handles OOABL and Progress as separate technologies
- Normally there can't be dependencies between codebases of different technologies
- SIG corrected this for OpenEdge in cooperation with proALPHA

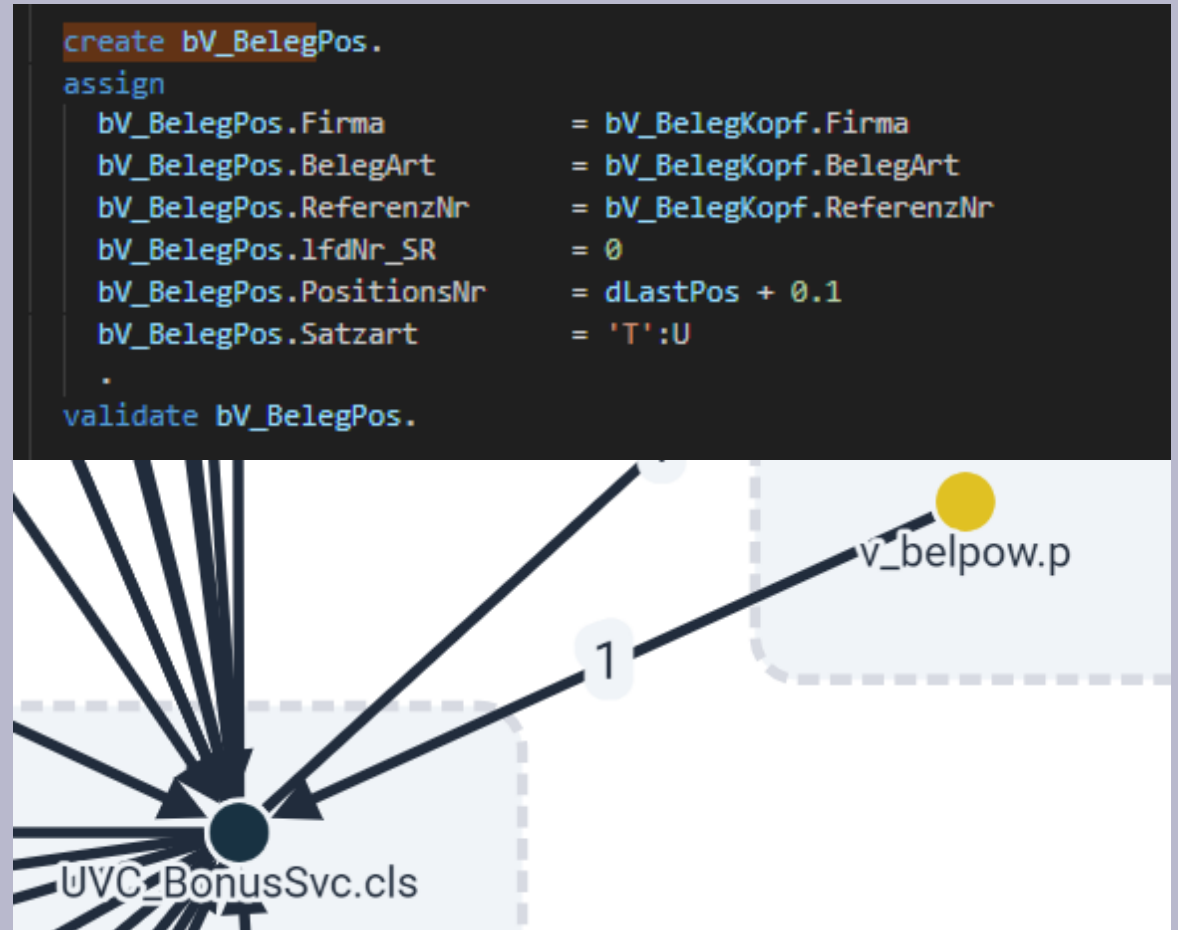

Technology Stack

| | | |
|----------|--------|----------|
| Progress | 575 PY | +5,38 PY |
| Abl | 120 PY | +7,90 PM |

```
dGradeValue = branche.vert.cls.UVC_BonusSvc:prpoInstance:dGradeValue(bUSM_BonusType.GradeBase,  
bS_Kunde.S_Kunde_Obj,  
bUVT_BonusBilling.USM_BonusContract_Obj,  
bUVT_BonusBilling.Gesamtbetrag,  
bUVT_BonusBilling.bonusfaehigerBetrag,  
bUVT_BonusBilling.Period,  
bUVT_BonusBilling.Year,  
bUVT_BonusBilling.Periodtype,  
bUVT_BonusBilling.Quantity).
```

Dependency Specialties

- Database Triggers are a very special construct
- Whenever a record is created or changed a database trigger fires
- This creates a dependency from the class or program to the trigger
- SIG implemented this in cooperation with proALPHA

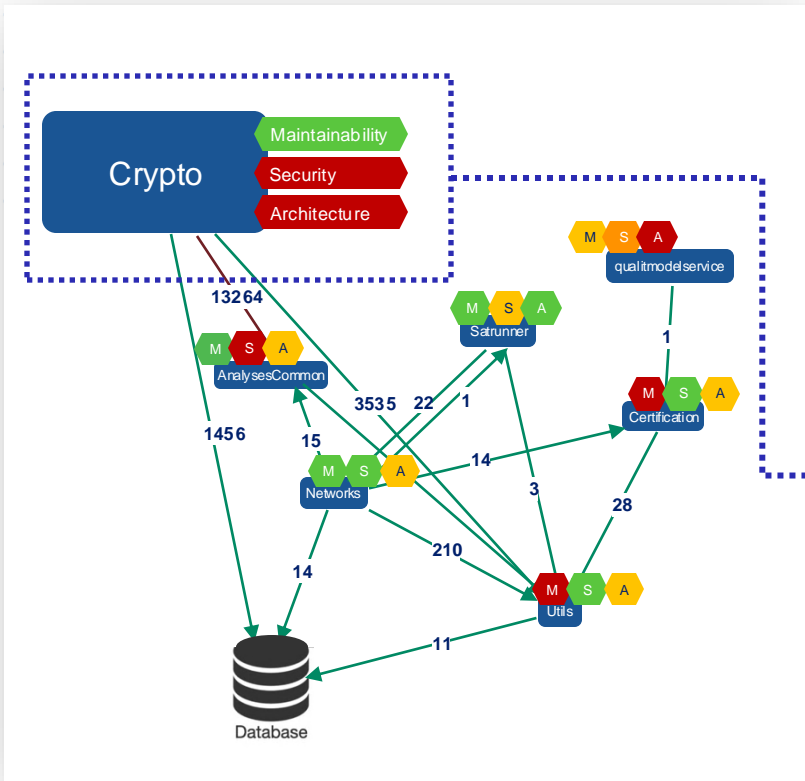

proALPHA Strategy for the near future

- Work on Duplications
- if we refactor other aspects first (for example complexity), we remove literal code duplications but the semantic duplication stays and is not detected anymore
- Work on cyclic dependencies
- Cyclic dependencies prevent us from splitting the code base into smaller pieces

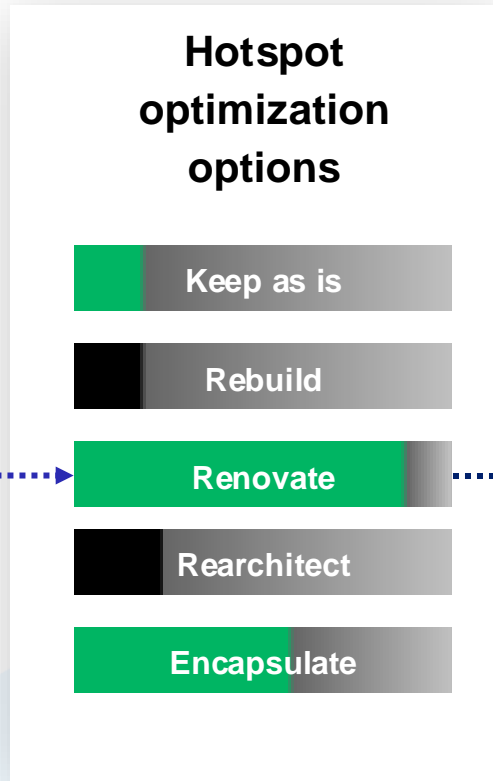

Improvement on Duplications

Quality & Security Management: What's Included

License to use Analysis tool (Sigrid)

- Data-driven software intelligence platform
- Analyses Progress source code
- Derive holistic insights into
 - Risks, costs, opportunities
 - On multiple software quality aspects

Consultancy to run the assessment

Fully documented assessment results

100+

Billion lines of code analyzed

730+

Million lines of code analyzed weekly

300+

Technologies scanned

12,000+

System inspections performed

Leveraging Sigrid® Platform

Analyzing source code quality and security – multi-metrics, multi-roles, and risk-based prioritized

Largest software benchmark in the world 1,000,000+ Inspections

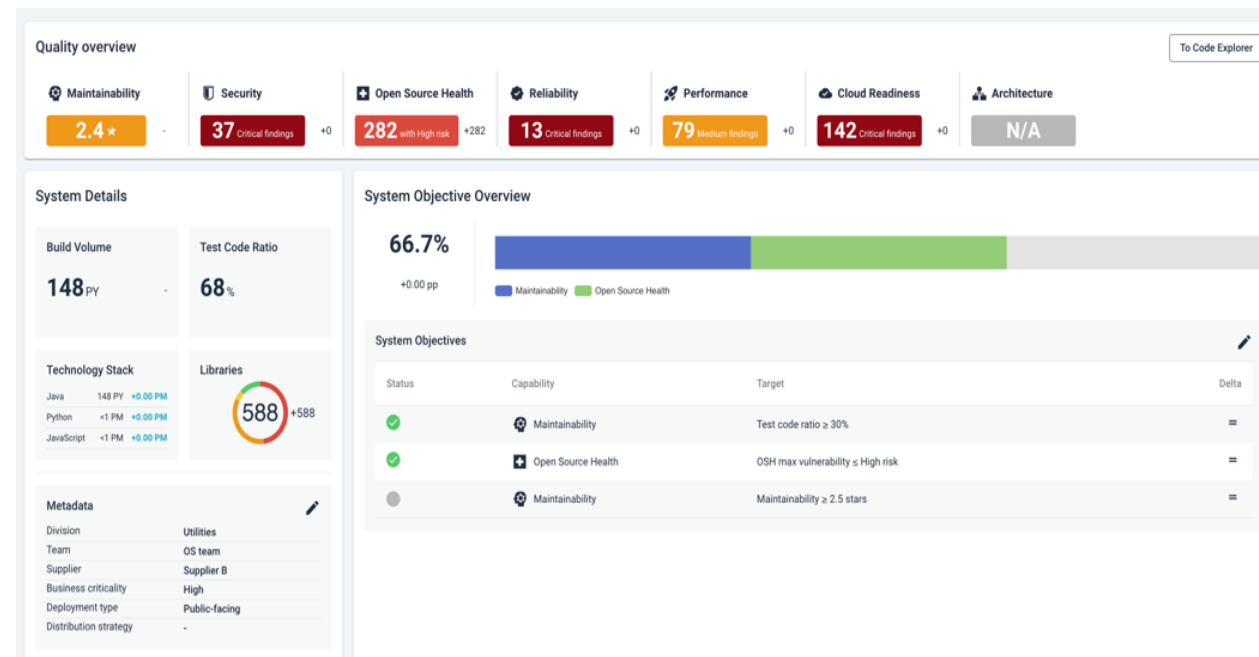

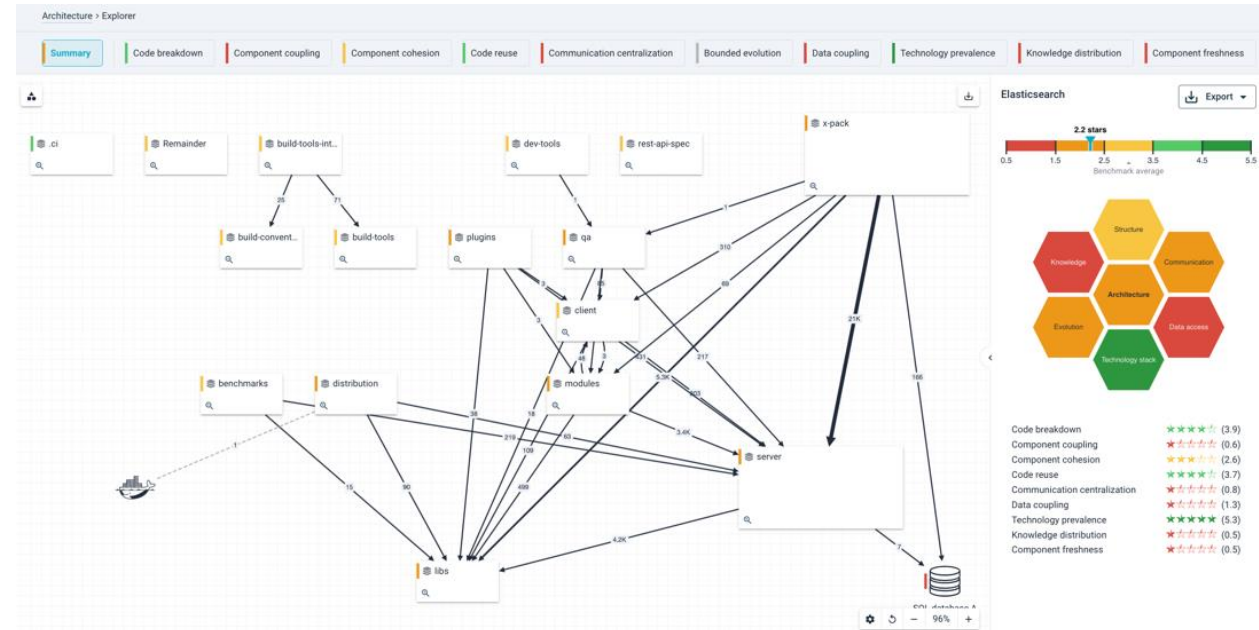

Why Application Quality and Security Management?

Create awareness and insights on current application state

Justify why **modernization** is needed and where and how it will pay off most

Get fact-based insights to drive innovation, manage risks and lower costs

Increase transparency from the **development team** to **boardroom** to set priorities for your software development investments
